

Positioning an experienced product designer for an AI-forward market

Homepage hero reviewed September 1, 2026.

AI should be the most forward tool in your toolbox, but it should amplify your existing story otherwise you will lose sight of your overall skillset, which is still relevant in today's market. It should be a combination

Overall Assessment/Summary

The current experience markets "designer who uses AI." The stronger and more defensible story is "senior product designer whose judgment, systems experience, and AI-native execution let him solve and ship complex products faster."

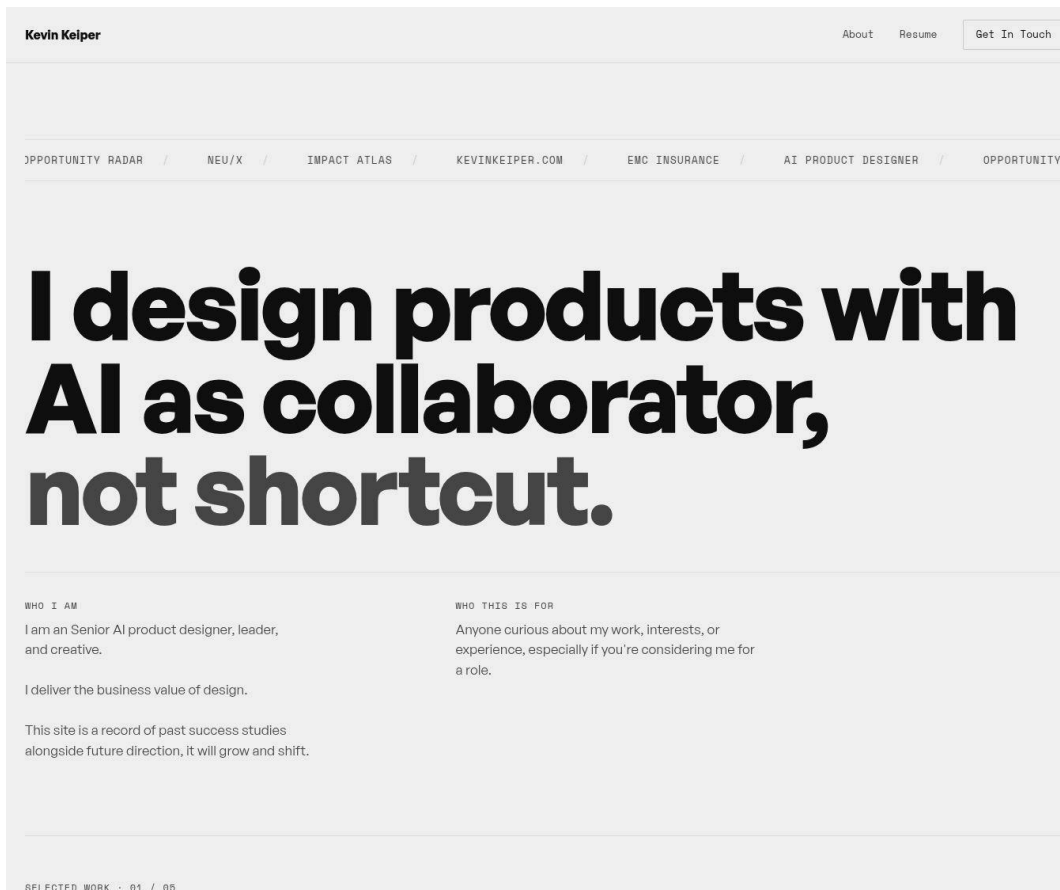

What is already working

- A distinctive, restrained visual system that feels intentional and senior. I love the design and the way you took it
- Real evidence of end-to-end product work, including research, systems thinking, interface design, automation, and shipped implementation, but this feels a bit lost in your current narrative and more of an afterthought when it is still a key part of your experience
- A timely AI emphasis supported by working products rather than only coursework or speculative concepts. This is great and can (and should be in today's climate) a focus, but its not all people are looking for as designers and you shouldn't lose sight of the full narrative of your experience
- Strong proof points, including shipped applications, 500+ sprints, and \$1M in revenue generated - however, with the caveat that these numbers do seem like they could be inflated and if someone asked you for proof, I would be concerned you are backing yourself into an AI hallucinated claim you can't readily back up. If you can great.

What is weakening the sale

- The AI narrative is so dominant that it compresses the rest of your experience into the background.
- The homepage leads with process philosophy rather than the business problems solved or any kind of solid answer to a hiring manager as to why they should hire you..
- Important proof is buried on the About page or deep inside case studies. Remember how much time someone is going to spend on your site and make sure what you want to share is top of mine
- Project descriptions explain products more often than they demonstrate your contribution and impact - it should be a balance of what the product is and what you did to get it to that point.
- The website and resume use different professional identities: "Senior AI Product Designer" and "Lead UI/UX Designer." I understand that AI is so prevalent everywhere, but again, I am concerned that you have not done senior AI product design work for hire, and that this narrative can possibly be problematic down the road if asked for specifics, launched etc. Again I think this goes back to your narrative and how we position AI as a too
- Several phrases sound defensive or self-protective when they could communicate the same values positively. Telling about limitations of the work does not need to be on the personal level - it can be approached as more of statements of fact and sometimes your narrative can be explaining what you feel is not your best work vs shifting up that narrative to be this is how I did it then and now that I know better I'd do it this way. All our design is sucky at some point - but its what we learn from that

1. Homepage: sell the value before the process

The hero is memorable, but it leads with Your's philosophy about AI rather than the value he creates.

"I design products with AI as collaborator, not shortcut" is a clear point of view, but it does not tell a hiring manager what you can do, what kinds of problems you solves, or why your experience makes your AI work more valuable.

"Not shortcut" also spends prime real estate answering an objection the visitor may not have.

Remember this is a marketing site. If I was hiring you this wouldn't tell me anything about your work and will be the first thing I see.

Recommended directions

I design and ship AI-powered products for complex business environments.

Senior product designer combining research, systems thinking, enterprise UX, and hands-on AI development to turn ambiguity into working software.

Alternate, more distinctive version:

Senior product judgment. AI-native execution. Products that actually ship.

Specific homepage changes

- Move the strongest evidence directly under the hero: 10+ years, three shipped apps, \$1M+ revenue influenced (again see note about validity etc above), enterprise and zero-to-one work.

- Replace "Who this is for" with proof, specialization, or a clear invitation tied to the kinds of roles you want to do. This is the first thing someone is going to see so tell them what you're looking for. Who this is for is whoever is looking at your page now tell them what you want
- Change "I am an Senior AI product designer" to "I am a senior AI product designer." if you are going to keep that in the narrative
- Replace "past success studies" with "selected case studies" or "selected work." Success studies isn't a common terminology and may be confusing and while I get what you're trying to do not very many people will be unsuccessful
- Rewrite each project card using problem, your contribution, and result - not a description of what was build.
- Make email and LinkedIn visible without requiring the visitor to complete a contact form if you're going to have them at all - I find my spam goes up considerably with a contact form and very few people use it so I dont even have this on my website - I assume people are coming to my website from another platform so this feels redundant to me. You can check your metrics and make the decision though.

2. AI positioning

Do not position yourself as a designer trying to become relevant through AI. The way your site can read at first glance now is that the only way you know how to design is with AI which just isn't true

Position yours as an experienced product designer whose AI capability multiplies already-earned product judgment.

The three claims he can credibly make

AI claim	Evidence the site should show
Uses AI in the design workflow	Show how AI improved research, synthesis, iteration, prototyping, communication, or delivery.
Designs AI-powered experiences	Show judgment around trust, explainability, uncertainty, user control, failure states, and responsible use.
Builds with AI	Show working products, technical collaboration, architecture decisions, tools, and shipped output.

The stronger market story

"I have the judgment of a senior product designer, and I can use AI to research, design, build, and ship at a level and speed that previously required a larger team."

This framing makes AI central without allowing it to erase enterprise UX, systems design, research, leadership, mentoring, or business impact.

3. Case studies: strong work, too much interpretation required

I know fitting each project into an established framework makes the job easier to build out the case studies, but it doesn't tell each story to its fullest.

Remember a case study is the narrative of what was done in the project and what the results are - that isn't going to follow the same path for each project so trying to cram each project into a double diamond or JTD framework isn't doing you any favors by default - if projects fit comfortably into a framework, great, use it but don't shortcut the narrative and explanation of your skills to fit into a framework - design never works like that

Think of each piece as a standalone marketing piece that is going to sell your skills. Someone is quick scanning your work, so make sure to highlight your entire story.

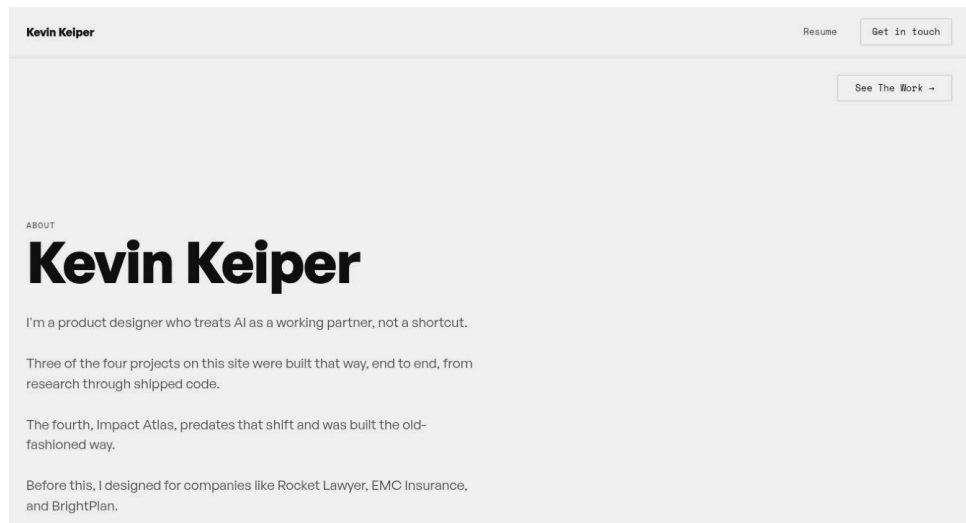

What to preserve

- The working product and end-to-end ownership.
- The three-day timeline and visible technical breadth.
- Tradeoffs and constraints, including data-access limitations.
- Product screenshots and evidence that the system is live and used.
- Any decision you made - that is both for and against something -
- Any collaborations - why they happened, how they happened, what the results for

What to (possibly) change

- Show the final product sooner and annotate the important decisions directly on the visuals if you want to make it a visual show don't tell approach (which you know I'm all about)
- Consolidate the idea, approach, research, execution, shipped/cut, and agent-layer sections into a shorter narrative summary. Remember someone is quick scanning your work
- Reframe "No formal study" as an intentional validation strategy, not an absence of research.
- Supplement activity counts such as scans and contacts with outcome evidence: time saved, conversations generated, decisions improved, repeat use, or ranking accuracy.

4. About page: promote the proof, soften the defenses

The About page contains valuable proof, but the opening remains centered on AI workflow.

What should move forward

Three apps in app stores, 500+ completed sprints, \$1M in revenue generated, and recognizable enterprise clients are among the strongest trust signals on the site - if they are true (see previous notes). They should appear on the homepage and support the hero immediately.

What should be reframed

The current "Working With Me" language includes "Don't be a hypocrite," "Don't be mean," "Don't disrespect me," and "Don't micromanage me." The values are reasonable, but in a hiring context the phrasing may sound guarded or invite the reader to imagine past conflict or see you more in a negative light

How I work best: Clear goals, candid feedback, mutual accountability, and room to own the solution.

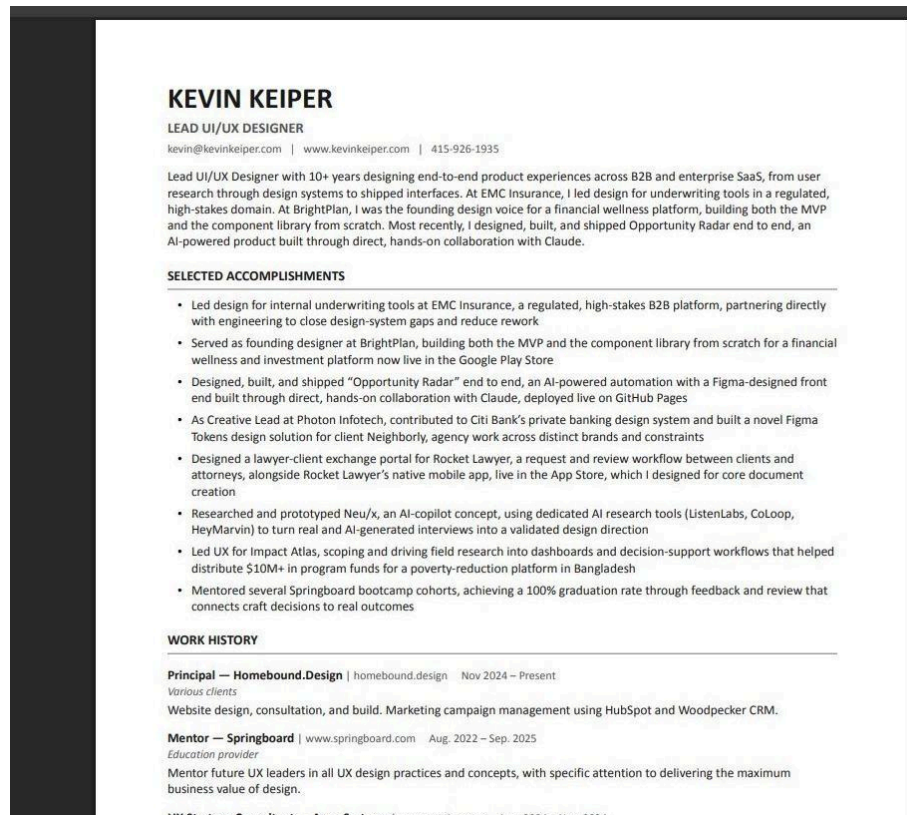

How I lead: I create clarity, build consensus, protect people's dignity, and keep teams focused on the problem rather than blame.

Tools and skills

Replace the long software inventory with capability groups. Tools change; senior capabilities retain value.

- Product strategy and research
- Interaction and systems design
- AI product development
- Prototyping and production
- Facilitation, leadership, and mentoring

5. Resume: align the identity and strengthen the evidence

The resume is credible but uses a different professional identity from the website.

Primary concern

The resume says "Lead UI/UX Designer" while the website says "Senior AI Product Designer." That forces the recruiter to decide which identity is current. "UI/UX Designer" also positions you more narrowly than you product strategy, systems, enterprise, leadership, and build experience warrant.

Also, this resume needs to be highly scannable upon quick glance just like the portfolio. I know we talked about bolding keywords or phrases in the past but would look at that again

Recommended resume direction

- Choose one market-facing title across the resume, website, LinkedIn, and outreach: Senior Product Designer, Lead Product Designer, or Senior AI Product Designer - having inconsistent messaging can be confusing
- Shorten the opening to a two-line positioning summary.
- Reduce the selected accomplishments to four or five highly differentiated proof points that show the breadth of your accomplishments across work areas.
- Use outcome-first bullets: improved X by doing Y, producing Z result.
- Let AI workflow details support business and product outcomes rather than substitute for them.

- Make \$1M generated, shipped applications, enterprise redesigns, and end-to-end ownership dominant if you feel you can defend it with data if questioned on validity of claims.

Senior product designer with 10+ years turning complex B2B and regulated workflows into clear, scalable products. Combines enterprise systems design, product strategy, research, and hands-on AI development to move from ambiguity to shipped software.

6. Messaging system to use across every surface

Positioning statement

Senior product designer building practical AI-powered products for complex business problems.

I combine product strategy, research, systems design, and hands-on AI development to move from ambiguous problem to shipped product.

Proof pillars

- Senior judgment: 10+ years across enterprise, B2B, regulated products, and complex workflows.
- AI-native execution: uses AI across research, synthesis, product definition, prototyping, automation, interface design, and production.
- End-to-end ownership: capable of moving from problem discovery through working software.
- Business outcomes: shipped applications, revenue generation, reduced rework, scalable systems, and operational clarity.
- Leadership leverage: mentoring, facilitation, consensus-building, and cross-functional influence.

Project-card formula

Use the same four-part structure throughout the homepage for the cards or anywhere you need a short summary - I know I said the projects don't necessarily follow a standard line, but when looking at the shorter content sections

1. What problem existed
2. What You specifically owned
3. What he designed or shipped
4. What changed as a result

Example:

Designed and built an AI-powered system that identifies companies showing hiring momentum before roles are posted. Role: product design and build. Shipped in three days. Current proof: 39 companies tracked and 4,631 contacts surfaced.

Editorial test

For every sentence, ask: Does this help a hiring manager understand your value, believe the claim, or take the next step? If it does none of those things, shorten it, replace it with evidence, or remove it.

7. Recommended priority order

#	Priority	Why it matters
1	Fix the homepage rendering problem	The work must display reliably without requiring the visitor to trigger an animation or scroll state.
2	Align the professional identity	Use one title and one story across the website, resume, LinkedIn, and outreach.
3	Rewrite the hero around employer value	Keep AI prominent, but connect it to complex problems, senior judgment, and shipped outcomes.
4	Move proof to the homepage	Surface experience, shipped products, revenue, enterprise credibility, and end-to-end ownership.
5	Rewrite project cards	Lead with problem, contribution, result, and one strong visual.
6	Compress the case studies	Reduce process narration and use annotated visuals to carry more of the explanation.
7	Reframe the About page	Translate defensive "don'ts" into positive working principles and leadership behaviors.
8	Tighten the resume	Remove repetition, sharpen outcomes, and make AI a multiplier of senior product experience.
